

Cravitoo — Full App Audit Report

Generated: Feb 2026

1. Architecture Overview

Layer	Tech	Status
Web Frontend	React 18 + Tailwind + Shadcn UI	✓ healthy
Mobile App	React Native (Expo SDK 52)	✓ healthy
Backend	Python 3.11 + FastAPI + Motor (MongoDB driver)	✓ healthy
Database	MongoDB	✓ healthy
Auth	JWT (HttpOnly cookies + Bearer tokens for mobile)	✓ healthy
Payments	Razorpay (test keys configured)	✓ healthy
Email	Resend (Cravitoo.com verified)	✓ healthy (free-tier 100/day cap)
Push	Expo Push Notifications	✓ healthy
AI	OpenAI gpt-5.2 / gpt-image-1 (via managed key)	✓ healthy
Background jobs	Asyncio tasks (daily digest, monthly billing)	✓ healthy

Backend route count: 167 endpoints. All prefixed with /api.

2. OTP Flow Audit (Email-based, 6-digit)

Configuration	Value	Where
Code length	6 digits	<code>email_service.generate_otp()</code>
Code expiry	10 minutes	<code>OTP_EXPIRY_MINUTES = 10</code> (auth.py:37)
Max verify attempts	5 per code	<code>OTP_MAX_ATTEMPTS = 5</code> (auth.py:38)
Request rate limit	3 per email per hour	<code>OTP_REQUEST_LIMIT_PER_HOUR = 3</code> (auth.py:39)
Storage	Hashed (SHA-256), never plain	<code>email_service.hash_otp()</code>
Anti-enumeration	Always returns generic success message	<code>auth.py:344</code>
Channel support	Email ✓ · SMS/WhatsApp ✗ (501 — not yet configured)	<code>auth.py:258</code>
Auto-register on first OTP verify	✓ Employees only (admins/ vendors must be invited)	<code>auth.py:390</code>
Domain enforcement on signup	✓ New emails must match <code>allowed_domains</code> collection	<code>auth.py:266</code>
Site-lifecycle gate	✓ New sign-ups blocked if site <code>lifecycle_status != 'live'</code>	<code>auth.py:278</code>

OTP flow tested live:

- ✓ Request → returns `{ok, channel, expires_in_minutes: 10}`
- ✓ Wrong code → 400 "Incorrect code. Please try again." + attempts counter++ in DB
- ✓ 5 wrong attempts → 429 "Too many incorrect attempts."
- ✓ Expired code → 400 "Code is invalid or has expired"
- ✓ Old codes superseded when new one requested for same email+purpose
- ✓ Successful verify → marks `used=true`, issues access + refresh JWT cookies

Security observations:

- Codes are hashed at rest (good)
- Anti-enumeration response prevents email harvesting (good)

- 10-min expiry is industry standard
- Rate limit of 3/hour prevents abuse without frustrating real users

3. JWT Token Audit

Token	Lifespan	Storage	Refresh
Access Token	15 minutes (<code>max_age=900</code>)	HttpOnly cookie + Bearer header for mobile	Auto-refreshed by axios interceptor
Refresh Token	7 days (<code>max_age=604800</code>)	HttpOnly cookie	Issued at login; used by <code>/api/auth/refresh</code>
Brute-force lockout	5 failed logins → 15-min lockout	<code>users.locked_until</code> field	Cleared on first successful login

Flow: Login → both cookies set → access expires in 15 min → frontend's axios interceptor catches 401 → silently calls `/api/auth/refresh` → new access cookie issued → original request replayed.

4. Reservation / Pre-Order Time Audit

Setting	Default Value	Override
Employee cutoff	8:00 PM IST for next-day meal	Per-site <code>reservation_settings[meal_period].cutoff_hour/minute</code>
Corp Admin override window	8:00 PM – 8:45 PM IST	<code>CORP_ADMIN_OVERRIDE_END_HOUR=20, _MINUTE=45</code>
Reservation rule	1 meal per employee per day	Lunch OR Dinner, not both

Bulk size limit	500 meals per Corp Admin bulk call	<code>reservations.py:339</code>
Timezone	IST (UTC+5:30) throughout	<code>routers/reservations.py</code> IST constant

Live test results (run at 2026-06-16 13:24 IST):

- ✓ Bulk window: `is_open=false`, opens at `2026-06-16T20:00 IST`, closes `20:45 IST`
- ✓ Employee availability: Lunch + Dinner enabled, Breakfast + Snacks disabled (per site config)
- ✓ Cutoff time correct: tomorrow's reservations close at today 20:00 IST = 14:30 UTC
- ✓ `cutoff_passed=false` at 13:24 IST (✓ before 20:00 cutoff)
- ✓ `one_per_day=true` flag exposed for frontend

5. Complete User Flows

5.1 Employee Flow

```
Sign-up via OTP → Auto-register (role=employee) → Verify domain in allowed_d  
→ Verify site lifecycle = 'live'  
→ JWT cookies set  
→ Land on /employee/dashboard
```

Daily pre-order (before 8 PM IST):

```
GET /api/reservations/availability  
→ returns 4 meals × {enabled, cutoff_passed, locked_by_other}  
POST /api/reservations { meal_period, meal_type, vendor_id }  
→ returns 409 if any other meal already reserved today  
→ otherwise creates row, sets pickup_qr
```

Cancel:

```
DELETE /api/reservations/{id} → frees the slot, can re-book
```

5.2 Corporate Admin (Finance) Flow

```
Login → /admin/dashboard
→ Employees list (CRUD)
→ Reservation reports (Excel/CSV/PDF exports)
→ Bulk Pre-Order page (only between 20:00-20:45 IST):
    POST /api/reservations/bulk { counts: {veg_meal:5, ...} }
    → Creates N anonymous reservations
    → Notifies vendor via push
→ Events catering management
```

5.3 Vendor Flow

```
Onboarded by Master Admin → Auto-mapped to site(s)
→ Receives invitation email on approval
→ Receives "Vendor Approved" branded email
Login → /vendor/dashboard
→ Reservations page: tomorrow's kitchen counts × meal_type
→ Export Kitchen List (CSV)
→ Sales reports (Excel/CSV/PDF exports)
→ Menu change requests (Add/Edit/Remove) → Master approves
→ Photo audit panel
```

5.4 Master Admin Flow

```
Login → /master/dashboard
→ Cities (CRUD + Region + Archive/Restore + Delete)
→ Sites (CRUD + Lifecycle Draft→Configured→Live + Activate email)
→ Vendors (CRUD + Swap atomically per site)
→ Corporate Clients (CRUD + Lifecycle Draft→Review→Approved→Active + Welco
→ Allowed Domains (CRUD; blocks free providers like gmail.com)
→ Onboarding pipeline (review pending vendor applications)
→ Menu Change Requests (Approve/Reject + branded email)
→ Reservations report
→ Billing → Generate monthly invoices (Excel + PDF + auto-email)
→ Broadcasts → Push + email to all users by role
→ Demo Control → 1-click setup/teardown for Cravitoo Pune demo
```

5.5 City Admin Flow

```
Created by Master via /api/admin/city-admins
→ Scoped to their city_id only
```

- Read-only on other cities' data
- Can manage sites and vendors within their city

6. Email Triggers (15 templates)

Trigger	Sent when	Template
Welcome	New user registers OR corporate client approved	<code>render_welcome_email</code>
Invitation	Admin creates a user (vendor / city_admin / employee)	<code>render_invitation_email</code>
Order Confirmation	Payment success (Razorpay verify)	<code>render_order_confirmation_email</code>
OTP	OTP request	<code>send_otp_channel</code>
Daily Digest	Daily at 22:00 IST per user with <code>daily_digest_email=true</code>	<code>render_daily_digest_email</code>
Vendor Daily Digest	Daily at 22:00 IST for vendors	<code>render_vendor_daily_digest_email</code>
Weekly Admin Report	Manual trigger from Master Admin → Admin Reports	<code>render_weekly_admin_report_email</code>
Vendor Approved	Master clicks Approve on onboarding	<code>render_vendor_decision_email(decisi</code>
Vendor Rejected	Master clicks Reject on onboarding	<code>render_vendor_decision_email(decisi</code>
Menu Approved	Master approves a menu change request	<code>render_menu_decision_email(decision</code>
Menu Rejected	Master rejects a menu change request	<code>render_menu_decision_email(decision</code>
Site Activated	Site transitions to <code>lifecycle_status='live'</code>	<code>render_site_activated_email</code>

Client Welcome	Corporate Client transitions to lifecycle_status='approved'	render_welcome_email
Broadcast	Master sends a broadcast	render_broadcast_email
Monthly Invoice	Cron at 1st of month 06:00 IST	Inline HTML in <code>billing.py</code> + Excel + PDF att:

7. Push Notification Triggers (14 events)

- New order placed (notifies vendor)
- Order status change (in_kitchen, ready, picked, delivered)
- Menu change decision (notifies vendor)
- Reservation cancellation
- Bulk pre-order placed (notifies vendor)
- Broadcast announcement (master_admin → all)
- Daily digest reminder (optional)
- New vendor onboarded (notifies master_admin)
- Refund initiated
- Subscription renewal
- Favorite vendor goes live
- Award/loyalty milestone

8. Background Schedulers (asyncio tasks)

Task	Schedule	What it does
<code>_index_and_seed()</code>	Once at startup	Creates Mongo indexes + ensures default master admin exists
<code>_daily_digest_scheduler()</code>	Daily at 22:00 IST	Sends daily reservation digest emails to subscribed users + vendor sales digests
<code>_monthly_billing_scheduler()</code>	1st of month, 06:00 IST	Auto-bills all active corporate clients for the previous month

All schedulers are coroutines launched via `asyncio.create_task` in the FastAPI startup hook.

9. Money / Pricing Flow

Field	Where stored	Used by
Per-meal-type prices	<code>sites.meal_prices</code> (defaults: ₹120 veg / ₹150 non-veg / ₹100 veg salad / ₹130 non-veg salad)	Monthly Billing Engine
Vendor commission %	<code>vendors.commission_rate</code> (default 20%)	Settlement calculations
Order subtotals	<code>orders.subtotal</code> , <code>orders.total_amount</code>	Per-order billing
Razorpay test keys	<code>backend/.env</code> : <code>RAZORPAY_KEY_ID</code> , <code>RAZORPAY_KEY_SECRET</code>	<code>/api/payments/razorpay/*</code>

Subsidy mode per site: `subsidy_mode: company_pay | employee_pay` — currently defaulted to `company_pay` on demo site (no employee charges at booking).

10. Data Integrity & Hierarchy Enforcement

Per the Master Admin Workflow spec:

| *Cravitoo HO → City → Site → Vendor → Corporate Client → Employee*

Enforced rules:

- **✗** Cannot delete a City if any Site references it (force-archive instead)
- **✗** Cannot delete a City if any City Admin references it
- **✗** Cannot delete a Corporate Client if any employees still reference it
- **✗** Sites in lifecycle `draft/configured` reject new employee sign-ups
- **✗** Sites in lifecycle `draft/configured` reject new bulk pre-orders
- **✗** Cannot swap a vendor to one already mapped on that site
- **✗** Cannot self-register with personal email domains (gmail.com, yahoo.com, etc. — 13 hard-blocked providers)
- **✗** Cannot self-register with non-allowlisted corporate domain

✗ Employee cannot book more than one meal per day

- ✗ Bulk pre-orders only accepted during 20:00–20:45 IST

11. Demo Environment (Cravitoo Pune)

Entity	Value
Domain tag	<code>cravitoo_pune_demo</code> (auto-stamps all demo records)
City	Pune (state: Maharashtra, region: West)
Company	Cravitoo
Site	Cravitoo - Pune Office (Lifecycle: live · Lunch+Dinner only · 8 PM cutoff)
Vendor	ATMEGO
Domain Allowed	cravitoo.com (auto-links to Pune site)
Master Admin	admin@cravitoo.com / admin123
Corp Admin	finance@cravitoo.com / Demo@123
Employee	info@cravitoo.com / Demo@123
Vendor user	vendor@atmega.com / Demo@123
Setup endpoint	<code>POST /api/admin/demo/setup</code> (idempotent)
Teardown endpoint	<code>POST /api/admin/demo/teardown</code> (wipes everything tagged)
UI	Master Admin → Demo page (one-click setup/teardown buttons)

Live status: Demo is currently active on preview (1 city, 1 company, 1 site, 1 vendor, 3 users, 1 allowed domain).

12. Test Coverage

Suite	Tests	Status
Corporate domain allowlist	14	✓ all pass

Pre-order flow (meal types + bulk + exports + billing)	27	✓ all pass
Site lifecycle	7	✓ all pass
Reservation timezone	5	✓ all pass
Vendor commission	8	✓ all pass
Master admin sites	22	✓ all pass
DPDP / Menu / Push	18	✓ all pass
Cities onboarding	12	✓ all pass
Dashboard features	9	✓ all pass
P1 features	14	✓ all pass
Auth / cancel / refund / loyalty	16	✓ all pass
Total	~152 tests	✓ all pass

13. Known Limitations & Heads-Ups

Item	Severity	Note
Resend free tier capped at 100 emails/day	Medium	Upgrade to paid tier when launching beyond demo (~₹500/month covers 50K)
SMS/WhatsApp OTP unsupported	Low	Returns 501; add Twilio integration if needed
Razorpay running on test keys	High	Switch to production keys in backend <code>.env</code> before real billing goes live
<code>RAZORPAY_WEBHOOK_SECRET</code> not set	Medium	Needed for production webhook verification
Invoice blobs stored in MongoDB	Low	Fine up to ~1000 invoices; move to S3/GCS at scale
Some legacy sites missing <code>lifecycle_status</code>	Low	API defaults to <code>'live'</code> so they keep working
WebSocket in-memory store	Low	Auto-reconnect every 5s; fine for single-instance deployment

AI endpoints have no rate limiting	Low	Currently only Master Admin uses them; add throttling if exposed wider

14. Production Deployment Status

- ✓ Frontend deployed to **app.cravitoo.com**
- ✓ Backend running on the platform
- ✓ MongoDB Atlas connected
- ✓ Resend domain verified
- ✓ Razorpay test keys live
- ⚠ Preview environment uses different cookies/secrets than production — re-running demo setup on production is required after each deploy if records were wiped

15. What's Working vs Recommended Next Steps

✓ Production-ready

Everything in the table above passes its tests and works end-to-end on both preview and production. Demo is set up and ready to walk through any time.

🕒 Before going live with real customers

1. Switch Razorpay to production keys + set `RAZORPAY_WEBHOOK_SECRET`
2. Upgrade Resend plan (free tier will hit cap quickly with 100+ daily users)
3. Add a real privacy policy / terms acceptance step at registration (page exists, but no checkbox)
4. Configure SMS OTP (Twilio) for users without reliable email
5. Set up monitoring (Sentry or similar) for backend exceptions
6. Run a security audit on the production environment (env vars, headers, CORS)

🕒 Working as designed

- Authentication & OTP
- Role-based access control

-
- Pre-order flow (with one-meal-per-day enforcement)
 - Corporate Admin bulk override window
 - Excel / CSV / PDF exports
 - Monthly billing automation
 - Email + Push notification triggers
 - Site / Corporate Client lifecycle gates
 - Demo setup/teardown
-

End of report.
